EDUCATION

University of Texas at Austin

Bachelor of Science in Computer Science, Minor in Statistics and Data Science

Austin, TX

Expected May 2028

EXPERIENCE

Sustainable Building Initiative (SBI)

Software Engineer

September 2025 - Present

Austin, TX

- Engineered a scalable, schema-driven questionnaire engine using TypeScript, React, and Supabase, reducing frontend boilerplate by **~80%** while supporting **8+ distinct input types** and validation for **40+ fields**.
- Architected a "**Decision Tree**" logic system that processes client input to trigger **3 specialized downstream workflows**, designed to scale to **10+ conditional branches**.
- Integrated **Supabase** with **row-level security** and a **1-second debounced autosave** pipeline, persisting responses via atomic **UPSERT** operations to ensure zero data loss across sessions.

Edikt Studios

Game Developer Intern

Aug 2022 - May 2025

Keller, TX

- Developed interactive gameplay features across **Unity** with **C#** and **Unreal Engine** with **Blueprints**, contributing to team and solo projects across a **2+ year** internship.
- Researched Unreal Engine tooling, game development workflows, and platform-specific production practices to support **multi-platform** development while meeting project deadlines.

PROJECTS

Perspect AI | Bun, Express, React, TypeScript, SSE, Gemini API

- Built an AI study tool that turns any academic topic into a **real-time debate** between expert personas, streaming perspectives, rebuttals, and a final study guide through **Server-Sent Events**.
- Implemented an **Express POST /api/debate** endpoint using **Bun** that orchestrates a multi-step AI pipeline with initial arguments, rebuttal rounds, and synthesized takeaways.
- Designed dynamic persona selection with **Gemini 2.5 Flash**, choosing the **3 most relevant personas** from a pool of **10 academic archetypes** for each user-submitted topic.

Morning Commute | Java, Apache Kafka, Spring Boot, Docker, PostgreSQL

- Created a 3-service ecosystem (trips, pricing, analytics) that streams trip events through **Apache Kafka** and aggregates them in 1-hour windows with **Kafka Streams**.
- Implemented a reactive pricing service that reads **real-time Kafka event streams** to calculate demand multipliers via a surge pricing algorithm, simulating production-grade ride-hailing logic.
- Created a time-series analytics pipeline that processes *TripRequested* and *TripCompleted* events, storing hourly demand data in **PostgreSQL** to track trends over time.
- Deployed a **5-container environment** (services, Kafka, Zookeeper, Postgres) with **Docker Compose** for low-latency communication between the services.

InboxOrganizer | Python, Google Cloud Platform (GCP), Docker, Ollama

- Built an AI-powered Gmail organizer that uses **Llama 3.1 8B** (by default) via **Ollama** to categorize high volumes of email, with a recommendation engine that suggests new labels for batches of **50+ untagged emails**.
- Reduced **LLM inference costs** and latency by **~30%** by implementing **context-aware body truncation** and **regex noise-filtering**, maintaining high categorization accuracy while staying within token limits.
- Automated secure email management using the **Gmail API** and **OAuth2**, featuring persistent session handling with token.json to eliminate manual re-authentication.
- Containerized the solution with **Docker**, configuring environment variable isolation for **Ollama** host management and cross-platform deployment.

TECHNICAL SKILLS

Languages: Java, Python, C#, HTML/CSS, JavaScript, TypeScript

Frameworks/Technologies: RESTful APIs, Docker, Spring Boot, Express, Bun, Git, Google Cloud Platform, Supabase, Ollama, Jest, React, Apache Kafka, Kafka Streams, PostgreSQL, SSE
